

Cerebral Science Studies in Anatomical Psychology, a Book for Artists, Physicians and Teachers (Classic Reprint)

The considerable advance in the science of man during the past century has been due to the method of comparative anatomy, the comparing together of all living creatures. To know one animal organism alone, even man, is to know nothing. We only know by comparison. Psychology to-day needs the same method comparison. The mind and character of man should be compared with that of the lion, the bull, and the lamb all the creatures below him, as well as with the highest ideals of art and religion above him. Animals influence both history and biography. Every nation has its emblem. It might be maintained that the character of the lion, the eagle, and the wolf have the closest bearing upon the formation of the temper of a nation destined to military supremacy, while the animus of the lamb, the ox, and the horse are not less important in view of the industrial disposition. Without going so far as this, it is perfectly certain that we must study the brains of animals if we are to arrive at a knowledge of the composition of human nature. Character of brutes, character of men, character of gods, such is our theme. (Typographical errors above are due to OCR software and dont occur in the book.) About the Publisher Forgotten Books is a publisher of historical writings, such as: Philosophy, Classics, Science, Religion, History, Folklore and Mythology. Forgotten Books Classic Reprint Series utilizes the latest technology to regenerate facsimiles of historically important writings. Careful attention has been made to accurately preserve the original format of each page whilst digitally enhancing the aged text. Read books online for free at www.forgottenbooks.org
