Anil Ananthaswamys extensive in-depth interviews venture into the lives of individuals who offer perspectives that will change how you think about who you are. These individuals all lost some part of what we think of as our self, but they then offer remarkable, sometimes heart-wrenching insights into what remains. One man cut off his own leg. Another became one with the universe. We are learning about the self at a level of detail that Descartes (I think therefore I am) could never have imagined. Recent research into Alzheimers illuminates how memory creates your narrative self by using the same part of your brain for your past as for your future. But wait, those afflicted with Cotards syndrome think they are already dead; in a way, they believe that I think therefore I am not. Whoor whatcan say that? Neuroscience has identified specific regions of the brain that, when they misfire, can cause the self to move back and forth between the body and a doppelganger, or to leave the body entirely. So where in the brain, or mind, or body, is the self actually located? As Ananthaswamy elegantly reports, neuroscientists themselves now see that the elusive sense of self is both everywhere

and nowhere in the human brain.
