

Metric Survey Specifications for Cultural Heritage

Widely used by heritage professionals, when specifying survey work throughout the historic environment sector, and by academics researching building conservation, this is the specification for the Metric Survey Framework Agreement. Since the publication of the second edition in 2009 there have been a number of significant advances in surveying technologies. These include the widespread use of laser scanning for measured building survey, the ubiquity of digital cameras, developments in photogrammetric software that enable the use of non-metric cameras, the use of Small Unmanned Aircraft (SUA) to capture aerial photography, the adoption of Building Information Modeling (BIM) and the increased generation of the required datasets using laser-scanning technology. Readers will include heritage professionals who need to specify metric survey work or survey contractors who need to work to the specification or produce quotes based on Historic England's requirements. Academics concerned with heritage recording and conservation will also be interested.
